

gc LSDA Project  
Chemistry Titration Video Clip

This is an area covered by both the specifications we teach ( AQA and OCR(Salters)) for practical assessment purposes and is therefore appropriate for use with all our chemistry students

It is a ten minute video, which goes through volumetric analysis step by step:

- an introduction into how volumetric analysis is used
- the apparatus and how it is prepared
- how to ensure accuracy in the procedure
- examples of indicators
- recording of results

The video can be shown in short sections as students carryout the practical or be shown in its entirety, used as revision, or for individual use by students who have missed the work through absence.

This mpg file can be used via media player or an appropriate disc player and TV
